

Plascide technology developed in Hong Kong to help people improve their health

A-oneTech launches anti-infective rehabilitation program to protect the needy

To give back to the community, A-oneTech has launched an anti-infective rehabilitation charity program. There are many potentially harmful effects of air pollution on health, from the slight physiological changes in the body to the visible symptoms such as nose and nose and throat itching, asthma, cough, chest pain or chest tightness; and patients with asthma or chronic respiratory diseases will be exacerbated if they are exposed to air pollutants.

Besides, impoverished patients may not be able to afford the expensive instruments. Therefore, the company would like to provide a free air sterilizer charity plan that using our their Plascide technology to eliminate indoor pathogens to make patients accelerate recovery.

The people who can benefit from this plan include the elderly, the patients, the chronically ill, and the rehabilitation. The project is to cooperate with the charity - Kam Wah Ching Sher Association Ltd. Groups or individuals who need it can obtain an application form from the charity. On a first-come, first served basis, after the verification from the committee, the company will arrange everything, including the delivery and maintenance. It is free of charge and can be returned at any time if you do not need to use. (If you don't need an air sterilizer, A-oneTech will take it back directly from your site. When the air sterilizer is recycled, the machine will be inspected and disinfected, and then sent to the next applicant.) It is hoped that this mode of operation can benefit more people, and protect the health of the needy.

Through this charity plan, we can see that the company continues its founding spirit and uses its technology to help people improve their health and thus improve their lives.
